

AI Could affect Our Privacy in the Future

AI is an advance technology. It Makes our lives faster but it can also affect the privacy by gathering our information from different sources, So we protect our data by using different security measures to make our lives safe. No doubt AI makes our lives easier, but we have also to make our lives safe.

Introduction

Today, one of the most advanced technologies is AI (Artificial Intelligence). It is completely changing the way we use technology. It works as a clever AI assistant making recommendations on several social media sites. Nowadays, AI is being used in every field. Business, Education, Health, Finance, and Government. Even though it is used in personal lives, like social media feeds and shopping (recommendation systems). But the problem is privacy. No doubt, it makes our lives easier and faster. But AI compromises our privacy the more we involve it in our lives. But the question is, does AI provide us comfort in our lives and make our lives faster, or will it affect our privacy in the future?

AI makes our lives faster but it is also create a threat of privacy

How AI affect our privacy

AI has a great impact on our privacy by the collection of our private data through different sources like different technology-related websites. The biggest problem is that AI companies have a massive amount of data. They collect this information from the user; for example, whenever we visit any website, they ask us to log in, and we have to give our information, such as email; otherwise, we cannot access the website. We are forced to give our data.

On the other hand, facial recognition technology is a major privacy threat. Not only our data but also our features and faces are used by various AI companies. This is used in banking systems, smartphone unlocking, airports, marketing, and many other security applications. This system improves security, but it also raises a question in my mind: it can destroy us at any time by using our personal information and data. Hacker can threat us by hacking our data and sell it for the sake of money. It is very dangerous for us

An interesting fact is that AI can predict a person's behaviour by analysing past activities. This is very beneficial for businesses and other services like it help to give recommendation during shopping on an e-commerce website, but it can create a big problem, such as ethical concerns.

Risk of AI in Future

With the passage of time, technology is increasing the privacy challenges for us. As artificial intelligence becomes more powerful day by day, it is becoming more deeply involved in our lives, for example, in smart homes, healthcare, financial services, and many other fields. Another threat of AI is its use in warfare. AI agents are being created, and our data is being used to train them, which we provide to various AI applications. This is a very big danger for us: it is not difficult to reach anyone. Now government use AI to keep a closer eye on people, and businesses also use AI to keep a closer eye on their competitors. But this is the cause of restricting the freedom and privacy of people

People have great concern about what artificial intelligence does to our data. Some problems are explain given below:

One of the biggest problems is the failure of official rules. The government should act on it and make rules and regulations that say that only the information companies really need can be collected, and we can protect and secure our data and also make our privacy protected.

The second biggest problem is the lack of transparency. People share their credentials like emails, names, and passwords, but they have no idea how it will be used. AI companies can share or sell people's information just for the sake of money.

In the future, it is possible that people's information will be used to make AI agents, and these agents will be used in wars. It will be very harmful for us. It not only harmful for data, it also harmful for people

How to balance technology with privacy Protection

One solution to this problem is to make the AI agents that protect our data at every cost. We should work on it to make people's lives easier and free from any kind of threat. No doubt AI makes our lives easier, but we also must make our lives safe.

One more important thing is that people should know what's going on. Now we all have this idea that our data should not be secure, and it can be retrieved from different sources, so we should make our passwords strong and secure.

We can follow these rules, such as checking our privacy settings after some days and changing the passwords if you think password is weak; don't share your credential information with other people. AI makes our lives faster but it is also creating a threat of privacy
